

Compute the full remaining residual

Retain oscillatory interactions, curl and cutoff corrections, and all other error terms.

Proposition 9.3; (9.3)

Correct waves, mean flow, pressure, and radial moments

Each cycle improves the decay of the residual.

$$\sigma_{j+1} = \sigma_j + \frac{1}{10}$$

Proposition 9.6; (9.8), (9.18)

Sum the corrections with shrinking cutoffs

The residual and all its derivatives vanish to every order at the singularity.

$$|\partial_x^\alpha \partial_t^b \mathcal{R}(u, p)| \leq C_{\alpha, b, N, X_1} q^N$$

Lemma 5.4 and Proposition 9.9; (3.4)

Localize and extend the residual as a smooth force

The force is smooth and compactly supported; the leading velocity blowup persists.

Lemmas 10.3 and 10.5; Theorem 1.1
